

# FIVE Theorems You Need to Know !!!!!

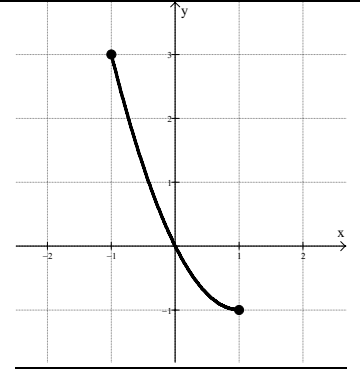

## 1. The Mean Value Theorem (MVT)

<p>The function <math>f(x)</math> must be:</p> <ol style="list-style-type: none"> <li>1. <b>continuous</b> (<math>a \leq x \leq b</math>) and</li> <li>2. <b>differentiable</b> (<math>a &lt; x &lt; b</math>)</li> </ol> <p>Then there is at least one number, <math>c</math>,  <math>a &lt; c &lt; b</math> such that:</p> $f'(c) = \frac{f(b) - f(a)}{b - a}$ <hr/> <p style="text-align: center;"><b>Remember:</b>  <b>Derivative equals slope</b></p>	<p style="text-align: center;"><u>Example:</u></p> <p>Find <math>c</math> if <math>f(x) = x^2</math> if <math>-1 &lt; c &lt; 2</math></p> <p><u>Solution:</u></p> $f'(c) = 2c = \frac{f(2) - f(-1)}{2 - (-1)}$ $\therefore 2c = \frac{4 - 1}{3} \Rightarrow \boxed{c = \frac{1}{2}}$ <hr/> <p style="text-align: center;"><b>This means that at <math>x = \frac{1}{2}</math>, the          derivative of <math>f(x)</math> equals the          slope from <math>-1 &lt; x &lt; 2</math> !!!!!</b></p>	
--	---	---

## 2. Rolle's Theorem

<p>The function <math>f(x)</math> must be:</p> <ol style="list-style-type: none"> <li>1. <b>continuous</b> (<math>a \leq x \leq b</math>) and</li> <li>2. <b>differentiable</b> (<math>a &lt; x &lt; b</math>) AND</li> <li>3. <math>f(a) = f(b)</math></li> </ol> <hr/> <p>Then there is at least one          number, <math>c</math>, <math>a &lt; c &lt; b</math> such that:</p> $f'(c) = \frac{f(b) - f(a)}{b - a} = 0$ <hr/> <p style="text-align: center;"><b>Remember:</b>  <b>Derivative equals slope = 0</b></p>	<p style="text-align: center;"><u>Example:</u></p> <p>Find <math>c</math> if <math>f(x) = x^2 - 2x</math> if <math>0 &lt; c &lt; 2</math></p> <p><u>Solution:</u></p> $f(0) = f(2)$ $f'(c) = 2c - 2 = 0 \Rightarrow \boxed{c = 1}$ <hr/> <p style="text-align: center;"><b>This means that at <math>x = 1</math>, the          derivative of <math>f(x)</math> equals 0.</b></p>	
---	--	--

## 3. The Intermediate Value Theorem (IVT)

<p>The function <math>f(x)</math> must be:</p> <ol style="list-style-type: none"> <li>1. <b>continuous</b> (<math>a \leq x \leq b</math>) and</li> <li>2. <math>m</math> is any number between <math>f(a)</math> and <math>f(b)</math></li> </ol> <p>Then there is at least one number, <math>c</math>, between  <math>a</math> and <math>b</math> such that: <math>f(c) = m</math></p> <hr/> <p style="text-align: center;"><b>Remember:</b>  <b>If <math>x</math> is "between" min and max <math>x</math>,          then <math>y</math> is "between" min and max <math>y</math>.</b></p>	<p style="text-align: center;"><u>Example:</u></p> <p>Given:</p> $f(x) = x^2 - 2x \text{ if } -1 \leq c \leq 1$ <p>Find the <u>possible</u> values of <math>f(x)</math>?</p> <p><u>Solution:</u> <math>f(-1) \geq f(x) \geq f(1)</math></p> $\text{So, } 3 \geq f(x) \geq -1$ <hr/> <p style="text-align: center;"><b>This means that <math>-1 \leq f(x) \leq 3</math>          Somewhere on the closed          interval <math>-1 \leq c \leq 1</math></b></p>	
--	---	---

# FIVE Theorems You Need to Know !!!!!

## 4. Average Value Theorem

We call this one the  
**“Average Y Value Theorem”**

This theorem allows you to calculate the **“average y value”**

$$\text{Formula} = \frac{1}{b-a} \int_a^b f(x) dx$$

**Remember:**  
**Always use this to find the  
 “Average Y Value”**

Example:

Find the average junk if

$$\text{junk}(x) = x^2 \text{ if } -1 < x < 2$$

Solution:

$$\begin{aligned} \text{AV} &= \frac{1}{2 - (-1)} \int_{-1}^2 x^2 dt = \frac{1}{3} \left[ \frac{x^3}{3} \right]_{-1}^2 = \\ &= \frac{1}{3} \left[ \frac{8}{3} - \left( \frac{-1}{3} \right) \right] = \frac{1}{3} \left[ \frac{9}{3} \right] = \boxed{1} \end{aligned}$$

**This means that the average junk equals one when  $-1 < t < 2$**

## 5. Test for Continuity

A function f, which is defined in some neighborhood of c, is said to be **continuous** at c if :

- 1) f(c) exists
- 2)  $\lim_{x \rightarrow c} f(x)$  exists
- 3)  $\lim_{x \rightarrow c} f(x) = f(c)$

**Remember:**  
**If you can graph  $f(x)$   
 without lifting your pencil,  
 then  $f(x)$  is continuous**

Example:

$$\text{Is } f(x) = \begin{cases} \frac{x^2 - 1}{x + 1} & x \neq -1 \\ 2 & x = -1 \end{cases}$$

CONTINUOUS at  $x = -1$ ?

Solution:

1.  $f(x) = -1$
2.  $\lim_{x \rightarrow -1} f(x) = -2$
3.  $f(x) \neq \lim_{x \rightarrow -1} f(x)$

**This means that  $f(x)$  is NOT  
 continuous at  $x = -1$**
